

Event streaming

When you subscribe to a stream, the WebSocket server will push updates to you when an event occurs on the stream you subscribed to.

Each such message contains `class` = `data` and the stream name (`stream`).

Sample event message:

```
{
  "class": "data",
  "stream": "BPX/USDT@ticker",
  "pair": "BPX/USDT",
  "price": "0.0123",
  "change": 10,
  "previous": "0.0122"
}
```
