Request/response

Each request sent to the WebSocket server must contain a type of operation (`op`) and a unique request ID (`id`). It's best to start with 1 and after each request increase this value by 1.

Sample request:

```
{
 'op': "ping",
 'id': 220
}
```

Each response from the websocket server contains `class` = `resp`, the same `id` as previously sent in the request, and a `success` (boolean) field. When `success` is `false`, the `error` (string) field with the error description is also included.

Sample response for success:

```
{
 'class': "resp",
 'id': 220,
 'success': true
}
```

Sample response for error:

```
{
 'class': "resp",
 'id': 220,
 'success': false,
 'error': "Missing data"
}
```
